WHAT IS BPA?

BPA is a raw material which is used to manufacture some dental resins/monomers such as BisGMA and BisEMA. These resins are commonly used to make composites and sealants.

BPA is not a common ingredient in dental materials and may only be detected in trace amount as a residue which is left behind during the manufacturing of BPA derived products. Based on current research, the ADA (USA) agrees with the authoritative government agencies that the low-level of BPA exposure that may result from dental sealants and composites poses no known health threat.
